

Phospho-JNK (Thr 183/Tyr 185)

Lumit™ Immunoassay Cellular System:

The Lumit™ Immunoassay Cellular System is a homogeneous bioluminescent assay that measures levels of target proteins in cell lysates when used with the appropriate primary antibody pairs (1). It combines immunodetection and NanoLuc Binary Technology (NanoBiT®) (2). In the Lumit™ Immunoassay Cellular System, NanoBiT® subunits (SmBiT and LgBiT) are conjugated to a pair of secondary antibodies against two different species (anti-rabbit, anti-mouse, or anti-goat). Seeded cells are lysed in multi-well plates using a Lumit™ compatible lysis solution and the target protein is detected by adding an antibody mix containing two primary antibodies against the target protein along with Lumit™ secondary antibodies. Binding of the primary/Lumit™ secondary antibody complexes to their corresponding epitopes brings NanoBiT® subunits into proximity to form an active NanoLuc® luciferase that makes light in proportion to the amount of the target protein (Fig. 1).

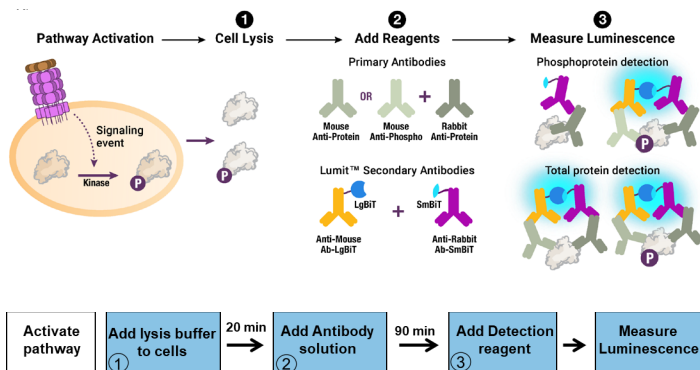

Figure 1. Illustration of Lumit™ Cellular Immunoassay. When the primary antibody pair includes a phospho-specific antibody, the luminescence reflects the level of the target protein phosphorylation (top panel). To detect total protein level, the same concept is used except both primary antibodies recognize non-phosphorylated epitopes on the protein (bottom panel). The luminescent signal generated is measured using a luminometer.

Phospho-JNK (Thr 183/Tyr 185) immunoassay:

Upon activation of JNK pathway with IL-1β, JNK is phosphorylated (Fig. 2). After lysis of the cell membrane, phospho-JNK (Thr 183/Tyr 185) can be detected using the reagents in Lumit™ Immunoassay Cellular System – Set 1 in combination with the anti p-JNK antibodies described in Table 1.

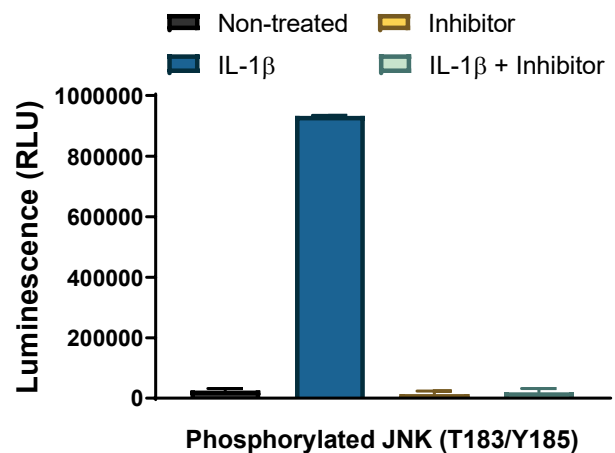

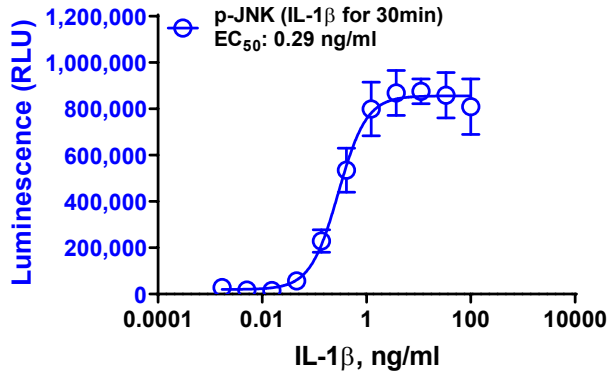

Figure 2. Detection of phosphorylated JNK using the Lumit™ Immunoassay Cellular System – Set 1. 50,000 seeded HepG2 cells were serum-starved overnight. The cells were then left untreated or pretreated with NG25 compound (10μM, 1hr) and then were untreated or treated with IL-1β (100ng/ml) for 30min. Phospho-JNK levels were measured following Promega Technical Manual TM613 and using the primary antibody conditions described in Table 1.

Lumit™ Immunoassay Cellular System Application Note

Cellular Pathway Analysis Series

A Activation of JNK phosphorylation with IL-1 β

B Inhibition of JNK phosphorylation with MAP4K2 inhibitor

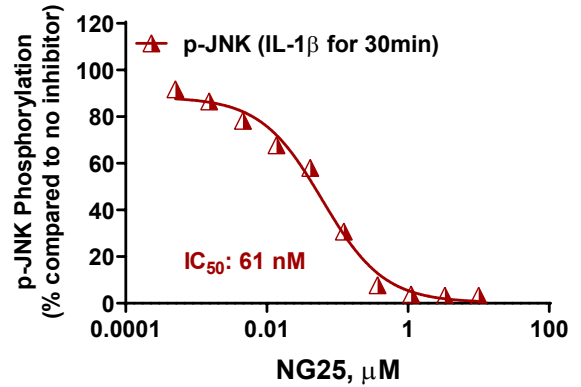

Figure 3. Activation and Deactivation of JNK pathway. 50,000 seeded HepG2 cells were serum-starved overnight. (A) The cells were then untreated or treated with various concentrations of IL-1 β for 30min before phospho-JNK was measured by Lumit™ Immunoassay Cellular System – Set 1 to determine the IL-1 β EC₅₀. (B) After starvation, the HepG2 cells were pretreated with various concentrations of the MAP4K2 kinase inhibitor NG25 for 1hr and then treated with IL-1 β (2ng/ml) for 30min before phospho-JNK was measured by Lumit™ Immunoassay Cellular System – Set 1 to determine the potency of the inhibitor (IC₅₀).

Lumit™ Immunoassay Cellular System Short Protocol

1. Add 10 μ l lysis solution to 40 μ l cells.
2. Incubate for 20min with shaking.
3. Add 50 μ l Antibody mix.
4. Incubate for 60-90 min.
5. Add 25 μ l of Lumit™ detection reagent.
6. Shake plate for 2min.
7. Read luminescence.

This is a quick reference protocol. For more details regarding cells and reagent preparation and detailed protocols see Lumit™ Immunoassay Cellular System Technical Manual TM613 at www.promega.com/protocols.

Table 1.

Antibody*	Target	Supplier	Cat. #	Working stock (μ g/ml)
p-JNK (Mouse)	Thr 183/Tyr 185	Cell Signaling Technology	9255	100
JNK (Rabbit)	Total	Cell Signaling Technology	9258	100

*Antibodies from other suppliers may work as well. They may need optimization following Promega Technical Manual TM613.
